

# Pretzels

---

1. Mrs. Brunner has recently learned how to make pretzels and wants to make some for her students. To make one batch of pretzels, she must use  $\frac{1}{2}$  cup of flour. To make enough pretzels for her class, she will need to make  $1\frac{1}{2}$  batches. How much flour will she need? (There is no right or wrong way to solve this. Push yourself to come up with more than one method to solve it.)

$\frac{1}{2}$

2. Flour commonly comes in 5-pound bags. If  $3\frac{1}{2}$  cups are 1 pound, how many cups are in the bag? (There is no right or wrong way to solve this. Push yourself to come up with more than one method to solve it.)
3. Will Mrs. Brunner have enough flour to make 15 batches of pretzels if she buys one 5 pound bag? (There is no right or wrong way to solve this. Push yourself to come up with more than one method to solve it.)
